Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

Introduction

In recent years, Moore's law has fostered the steady growth in the field of digital image processing, though computational complexity remains a significant problem for most of the digital image processing applications. At the same time, research in the field of optical image processing has matured, potentially bypassing the limitations of digital approaches and giving rise to new applications. The aim of this conference was to create a joint forum for both research and application communities to share expertise, to solve present-day application bottlenecks, and to propose new application areas. Consequently, this conference had a broad scope, ranging from basic and applied research to dissemination of existing knowledge.

This volume consists of the papers presented at the SPIE Optical and Digital Image Processing Conference which took place from 7–9 April, 2008, in Strasbourg, France.

The contributions were grouped in sessions covering holography-interferometry, industrial applications, wavelet methods, compression technologies, advanced camera systems, wavelet applications and denoising, watermarking, advanced imaging medical imaging, and the interaction between optics and digital image processing. We thank all the participants and all those who worked hard to make this conference so successful. Special thanks to all the reviewers that helped us to improve the quality of the final proceedings.
